3.5 Developments in Large-site Access Capacity

The following graphs aim to give some idea of the developments in large-site access capacity. Graphs 3.5.1 and 3.5.2 give the information for those NRENs with a large-site access capacity in 2002 of at least 150 Mb, graphs 3.5.3 and 3.5.4 give the same information for NRENs with a large-site access capacity below that.

Note that a number of countries offer a range of access capacities. That range is not reflected in these graphs; an average has been taken. (Full information is available from the country entries on the Compendium website.)

In Graph 3.5.2, the Czech Republic and the Netherlands plan to offer large-site access capacities of 10 Gb.
Information for countries outside of the range:

Ireland offered a large-site access capacity of 50 Mb; Austria, Estonia and Slovenia offered 100 Mb.

Information for countries outside of the range.

The countries outside of the range all plan to offer 1 Gb large-site access capacities in 2004.
